

Pneumonia Aetiology

Why is it so difficult to distinguish pathogens from innocent bystanders?

David Murdoch
Department of Pathology
University of Otago, Christchurch

THE **INFECTION** GROUP

Outline

- Background
- Diagnostic challenges for pneumonia aetiology
- Research needs
 - Innovative new diagnostic tools
 - New approaches to data analysis
 - Alternative paradigms of pneumonia aetiology

Updated: July 5, 2012

Normal lung tissue

Pneumonia

Average annual incidence of invasive pneumococcal disease by age and gender (■, female; □, male), 1998–2005.

PNEUMONIA

THE FORGOTTEN
KILLER OF
CHILDREN

unicef 

 World Health
Organization

Burden of Childhood Pneumonia

Deaths

- **7.6 million deaths** among children <5y in 2010
- **18% (1.4 million) were caused by pneumonia**

Liu et al. *Lancet* 2012; 379: 2151-61

Global causes of mortality in children <5 years

A Wide Variety of Organisms can Cause Pneumonia

Bacteria

- *Streptococcus pneumoniae*
- *Haemophilus influenzae*
- *Mycoplasma pneumoniae*
- *Moraxella catarrhalis*
- *Legionella* species
- *Chlamydophila pneumoniae*
- *Staphylococcus aureus*
- *Klebsiella pneumoniae*
- *Acinetobacter* species
- *Pseudomonas* species
- *Coxiella burnetii*
- *Chlamydia psittaci*
- *Francisella tularensis*
- *Yersinia pestis*
- *Bacillus anthracis*
- *Burkholderia pseudomallei*
- *Mycobacteria*

Viruses

- Influenza A and B
- Respiratory syncytial virus
- Adenoviruses
- Parainfluenza viruses
- Coronaviruses
- Varicella zoster virus
- Measles virus
- Cytomegalovirus
- Herpes simplex virus

Fungi

- *Pneumocystis jiroveci*
- *Cryptococcus neoformans*
- *Coccidioides immitis*
- *Histoplasma capsulatum*

Parasites

- *Paragonimus westermani*

This list is incomplete!

Causes of Severe Pneumonia

*HIV-negative children in developing countries
1995-2005*

Why is it Important to Know the Causes of Pneumonia?

- Better direct antibiotic treatment
- Identification of unexpected or unusual causes
- Detection of antibiotic resistance
- Surveillance
- Informing and vaccine design

Case Report

- 7 month old boy from Mali
- Admitted with very severe pneumonia
- Antibiotics given in the community 2 days previously

Induced sputum microscopy (100X)

Induced sputum microscopy (1000X)

Induced Sputum Culture

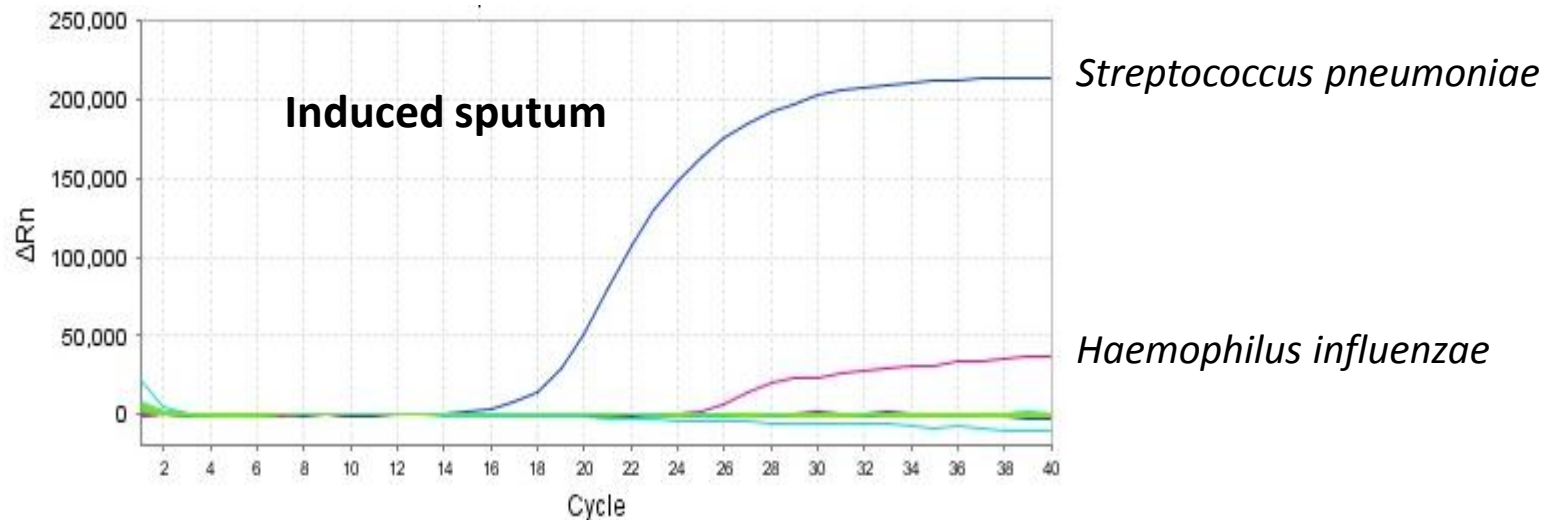

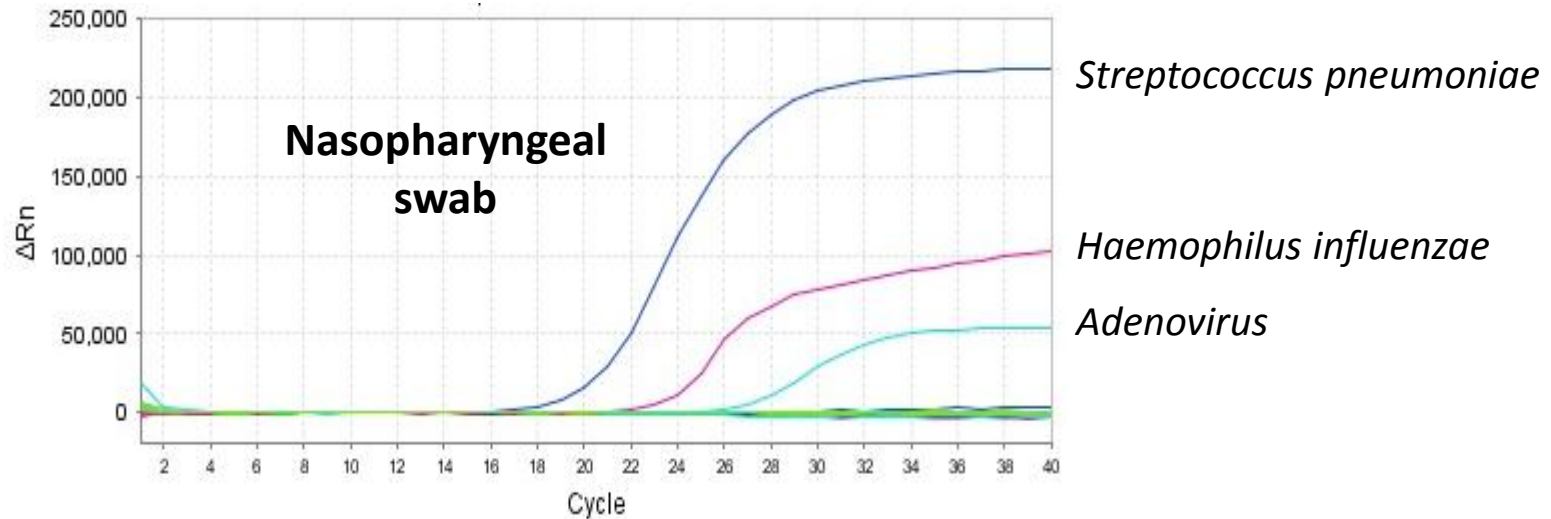

3+ *Streptococcus pneumoniae*

3+ *Haemophilus influenzae*

1+ Oropharyngeal flora

Multiplex PCR Results

Summary of Results

Specimen	Test	Potential pathogen
Blood	Culture	None
Induced sputum	Microscopy	Gram-positive diplococci
	Culture	<i>S. pneumoniae</i> , <i>H. influenzae</i>
	PCR	<i>S. pneumoniae</i> , <i>H. influenzae</i>
Nasopharyngeal swab	PCR	<i>S. pneumoniae</i> , <i>H. influenzae</i> , adenovirus

What is/are the causative pathogen(s) in this child's pneumonia?

Specimen	Test	Potential pathogen
Blood	Culture	Not collected
Induced sputum		Not collected
Nasopharyngeal swab	PCR	<i>S. pneumoniae</i> , <i>H. influenzae</i> , adenovirus

Fundamental Issues in Determining Pneumonia Aetiology

(1) Specimen collection

- Difficulty in obtaining specimens from the site of infection is a fundamental problem in pneumonia diagnostics

Lung Aspirates

- Specimen collected from the site of infection
- Is a normally sterile specimen
- Only collected if there is lobar illness in hospitalized patients
- Good safety profile, but perceived risk high
- Rarely done anymore

Sputum

- Comes from the lower respiratory tract
- But is often contaminated with oropharyngeal flora
- Difficult to obtain from young children

Nasopharyngeal Specimens

- Relatively easy to collect
- May not be representative of the lower respiratory tract
- Nasopharynx is the site of replication of most common respiratory viruses
- Colonization with bacteria is common

Blood

- Relatively easy to collect
- Highly specific for aetiology
- Only positive in 10% bacterial pneumonia

Fundamental Issues in Determining Pneumonia Aetiology

(2) Differentiating innocent bystanders from true pathogens

- colonisers
- viruses from coincidental recent upper respiratory infection

Some pneumonia pathogens can also colonise healthy people

Lancet Infect Dis 2004; **4**: 144–54

A Wide Variety of Organisms can Cause Pneumonia

Bacteria

- *Streptococcus pneumoniae*
- *Haemophilus influenzae*
- *Mycoplasma pneumoniae*
- *Moraxella catarrhalis*
- *Legionella species*
- *Chlamydophila pneumoniae*
- *Staphylococcus aureus*
- *Klebsiella pneumoniae*
- *Acinetobacter species*
- *Pseudomonas species*
- *Coxiella burnetii*
- *Chlamydia psittaci*
- *Francisella tularensis*
- *Yersinia pestis*
- *Bacillus anthracis*
- *Burkholderia pseudomallei*
- *Mycobacterium tuberculosis*

Viruses

- Influenza A and B
- Respiratory syncytial virus
- Adenoviruses
- Parainfluenza viruses
- Coronaviruses
- Varicella zoster virus
- Measles virus
- Cytomegalovirus
- Herpes simplex virus

Fungi

- *Pneumocystis jiroveci*

- *Coccidioides immitis*
- *Histoplasma capsulatum*

Parasites

- *Paragonimus westermani*

Detection of Respiratory Pathogens by PCR from Nasopharyngeal Swab Specimens in Kenyan Children with Pneumonia and Controls

Pathogen	aOR for Case Patients vs Controls Without URTI		aOR for Case Patients vs All Controls	
	aOR	95% CI	aOR	95% CI
RSV A	12.5	3.1–51.5	3.8	2.2–6.6
RSV B	∞	<.001 ^a	11.9	3.7–38.2
Adenovirus	0.5	.3–1.0	0.7	.4–1.2
Rhinovirus	1.0	.6–1.5	1.0	.7–1.3
Parainfluenza 1	1.4	.2–11.6	0.9	.3–2.7
Parainfluenza 2	0.8	.1–7.1	0.3	.1–.8
Parainfluenza 3	1.3	.6–3.2	0.9	.5–1.6
Parainfluenza 4	1.1	.2–5.0	1.4	.4–4.5
Influenza A	1.4	.2–11.4	0.7	.2–2.2
Influenza B	∞	1.0 ^a	∞	1.0 ^a
Influenza C	∞	1.0 ^a	0.8	.1–4.8
Coronavirus 229E	0.7	.3–1.9	0.6	.3–1.1
Coronavirus OC43	2.0	.5–8.8	1.0	.5–2.1
Coronavirus NL63	∞	1.0 ^a	1.0	.2–5.4
HMPV	4.6	.6–34.4	2.8	.9–8.1
<i>Mycoplasma pneumoniae</i>	0.3	.1–1.9	0.5	.1–2.1

Most pathogens were found in a similar proportion of cases and controls

Classical Case-Control Analysis

PERCH Study (NP/OP PCR)

~8000 children aged <5 years from developing countries

Use of a Rapid Test of Pneumococcal Colonization Density to Diagnose Pneumococcal Pneumonia

W. C. Albrich,^{1,5} S. A. Madhi,^{1,2} P. V. Adrian,^{1,2} N. van Niekerk,¹ T. Marelets,¹ C. Cutland,^{1,2} M. Wong,³ M. Khoosal,⁴ A. Karstaedt,³ P. Zhao,⁶ A. Deatly,⁶ M. Sidhu,⁶ K. U. Jansen,⁶ and K. P. Klugman^{1,7,8}

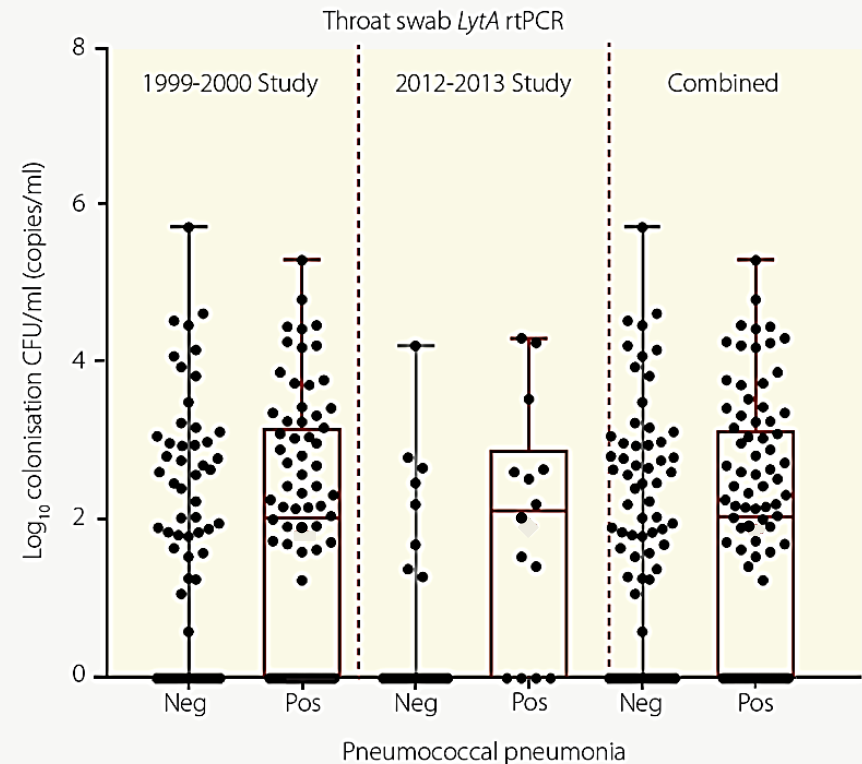

Figure 1. Quantitative colonization densities in human immunodeficiency virus-infected patients with community-acquired pneumonia.

Oropharyngeal Colonisation Density

- No cut-off in pneumococcal load clearly distinguishes pneumococcal pneumonia
- AUC 0.77 (95%CI 0.71, 0.82) for the combined dataset

Fundamental Issues in Determining Pneumonia Aetiology

(3) Understanding polymicrobial infections

- Multiple pathogens are being detected more frequently in individual pneumonia patients
- This is a consequence of:
 - Testing for a wider variety of targets (e.g. multiplex PCR)
 - Testing of multiple specimen types
- Most recent studies of pneumonia aetiology report about 25% polymicrobial infections

Etiology of Community-Acquired Pneumonia: Increased Microbiological Yield with New Diagnostic Methods

Niclas Johansson,^{1,3,4} Mats Kalin,^{1,3,4} Annika Tiveljung-Lindell,^{2,5} Christian G. Giske,^{2,5} and Jonas Hedlund^{1,3,4}

Departments of ¹Medicine and ²Microbiology, Tumor, and Cell Biology, Karolinska Institutet, and ³Infectious Diseases Unit and Departments of ⁴Infectious Diseases and ⁵Clinical Microbiology, Karolinska University Hospital, Solna, Stockholm, Sweden

≥2 pathogens
identified in 35%

Bacterial vs Viral Pneumonia

- This is a traditional aetiological classification of pneumonia
- However, there is increasing interest in bacterial-viral interaction in the pathogenesis of pneumonia

I, J. E. DEARDEN, Registrar of Births and Deaths for the Sub-district of ECCLESALL WEST CENTRAL, in the County of SHEFFIELD, O.B.
do hereby certify that this is a true copy of the Entry No. 445 in the Register Book of Deaths for the said Sub-district, and that such Register Book is now legally in my custody.

WITNESS MY HAND this

4th day of November 1918

Registrar of Births and Deaths.

The Act 3 & 4 Geo. V., cap. 27, section 3, enacts that "FORGERY of the following documents, if committed with intent to defraud or deceive, shall be FELONY and punishable with Penal Servitude for any term not exceeding fourteen years:—Any register or certificate of Birth, Baptism, Marriage, Death, Burial, or any part of any such Register, or any Certified Copy of any such Register, or of any part thereof."

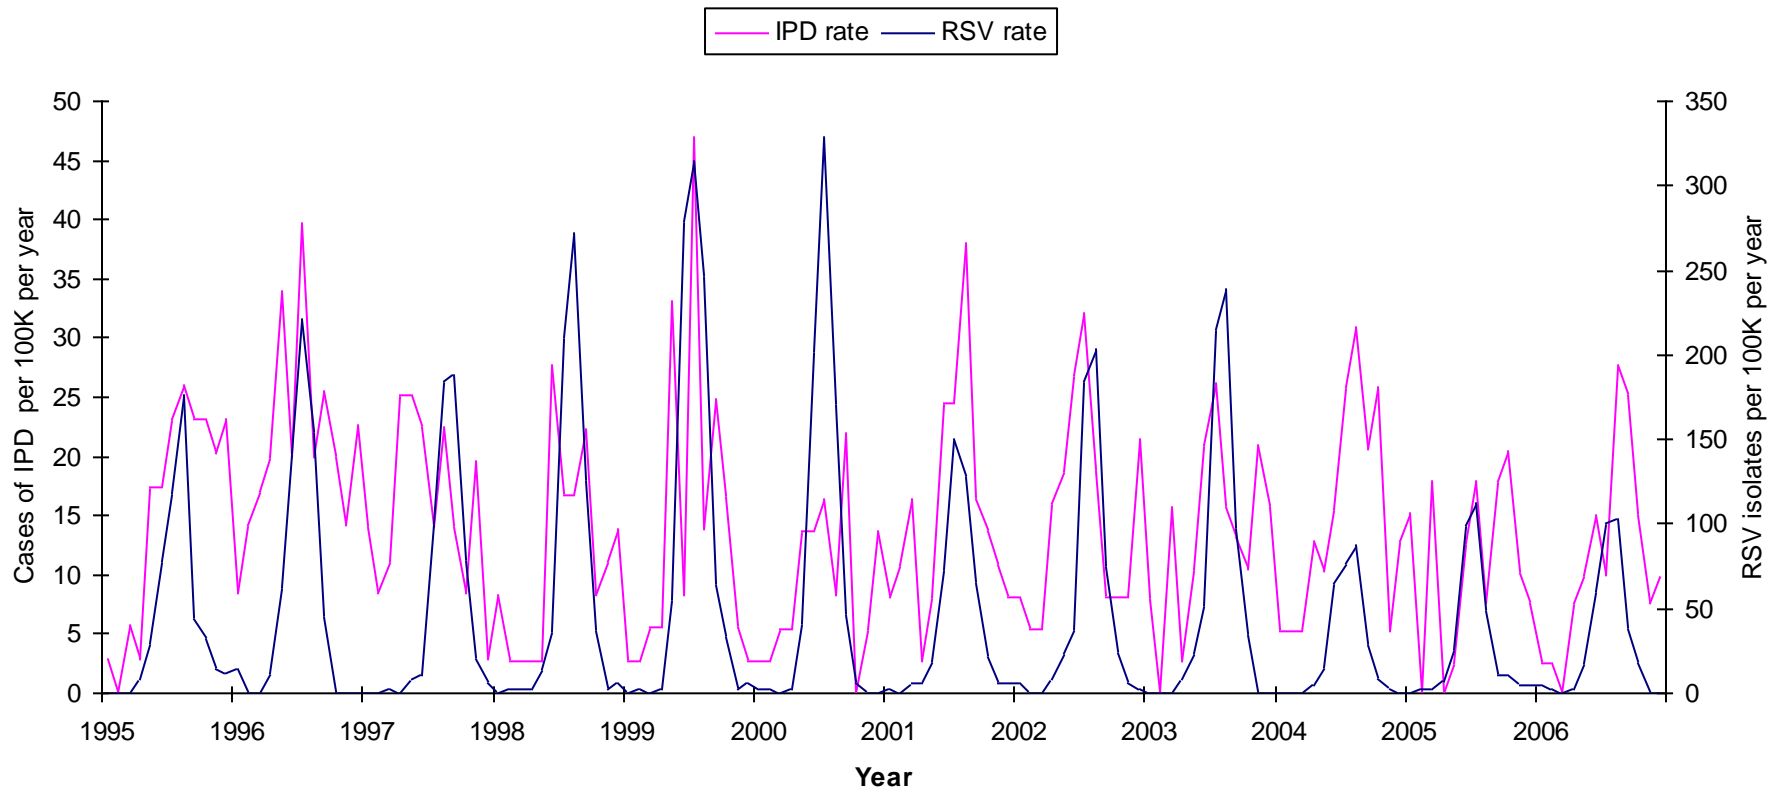

FIG. 2. Examples of adherence of *S. pneumoniae* CCUG 10175 to an uninfected A549 cell (a), an A549 cell infected with adenovirus type 5 (b), and an A549 cell infected with adenovirus type 9 (c).

Rates of Invasive Pneumococcal Disease and RSV Infection in Christchurch, NZ 1995-2006

**How do we distinguish the pneumonia “signal”
from among the diagnostic and analytic “noise”?**

Pneumonia Aetiology Research

- **We need:**
 - Innovative new diagnostic tools
 - New approaches to data analysis
 - To think about alternative paradigms of pneumonia aetiology

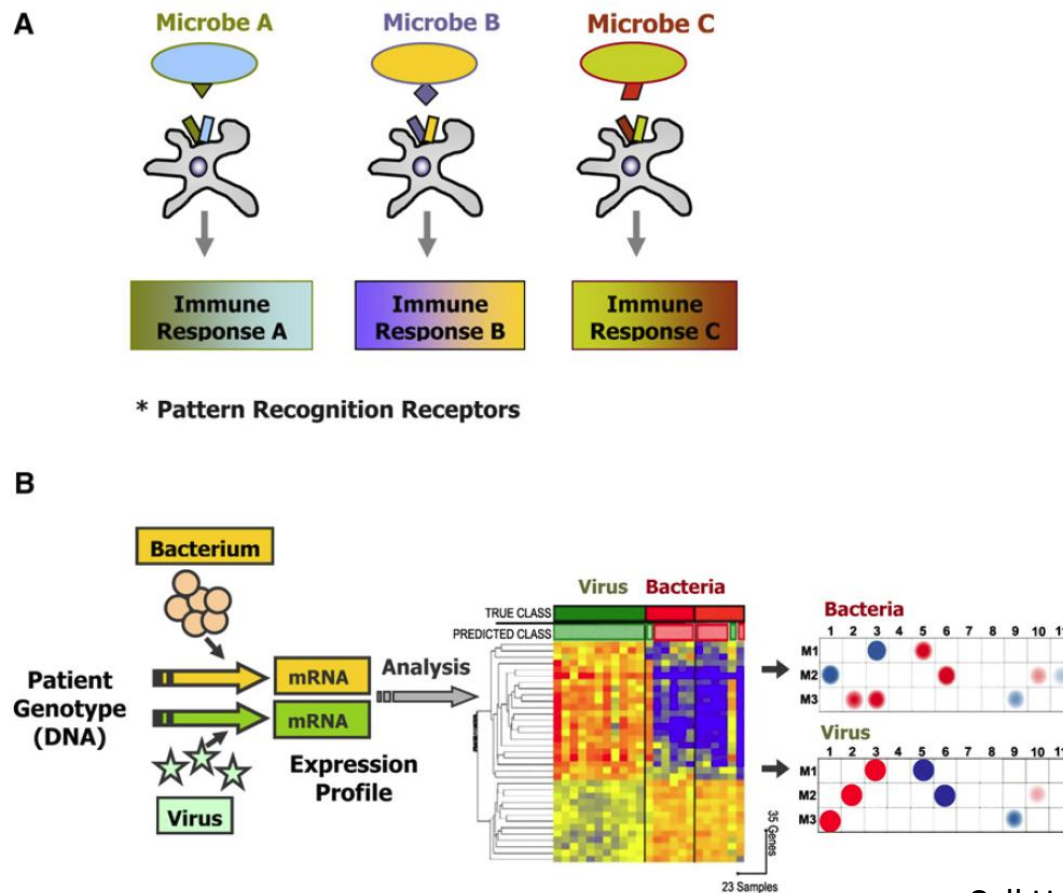

New Diagnostic Tools

- Biomarkers
 - Aetiological diagnosis
 - Severity assessment
- Breath analysis

New Diagnostic Tools

- Host gene signatures

New Approaches to Data Analysis

- Analytical challenges:
 - Indirect observation of infection site
 - Poor sensitivity of diagnostic tests
 - Similar detection in cases and controls does not rule out pathogen as a putative aetiologic agent
 - Not all specimen types from cases are collected from controls
 - Combining results from multiple specimens/tests
 - Measurement error in lab tests
 - Pathogen inter-relationships

Analytic approaches to describing pneumonia aetiology

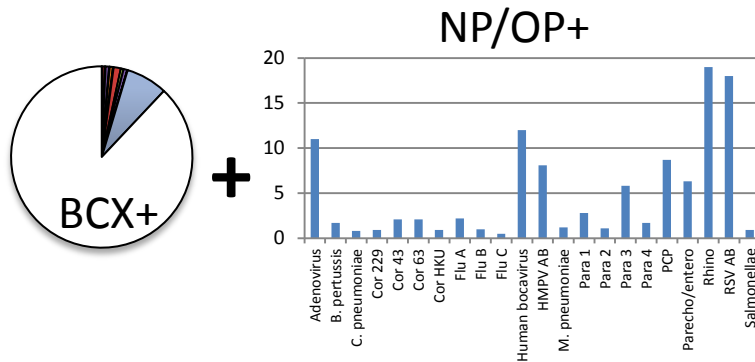

The PERCH Study Group

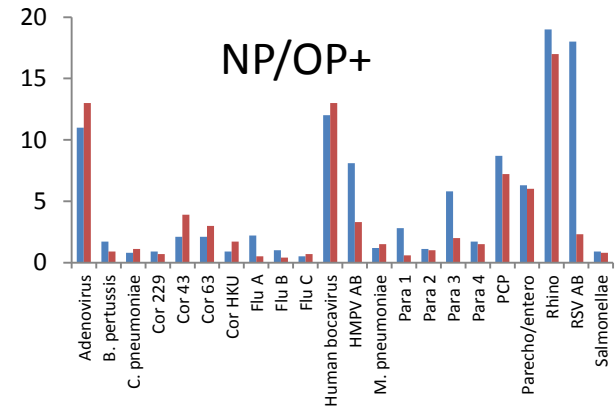

Analysis plan...

A series of descriptive analytic approaches

1. Cases only - descriptive

2. Classical case-control

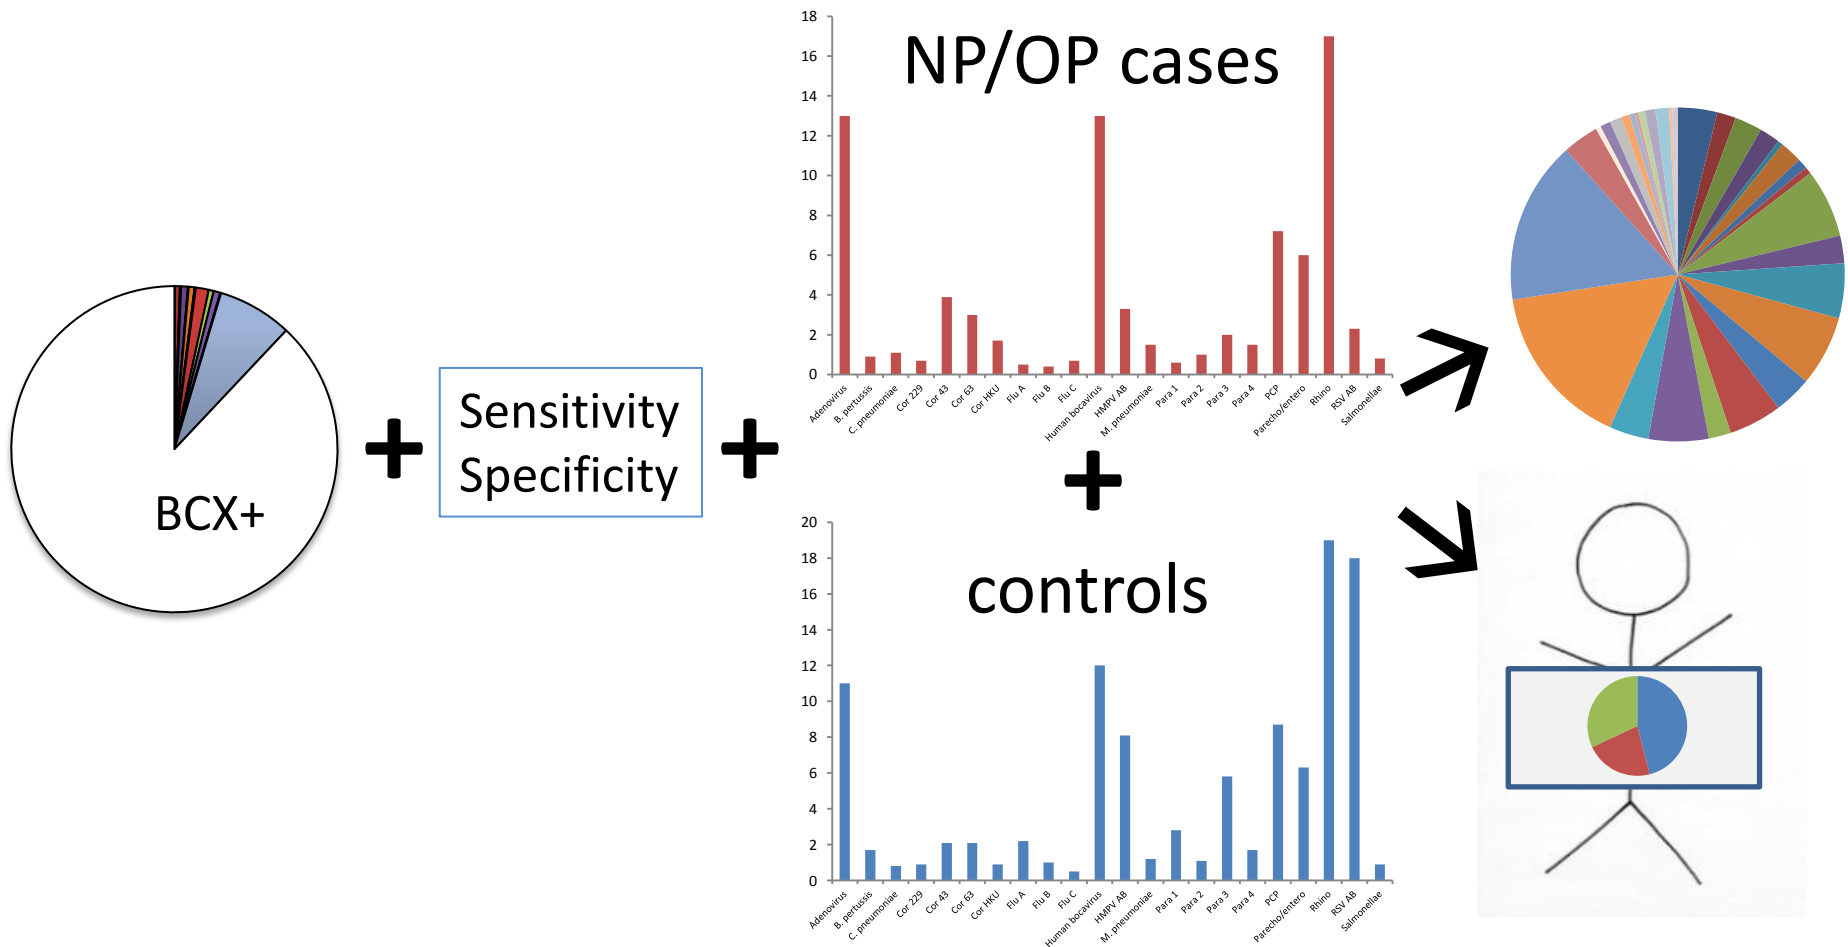

3. Attributable Fraction case-control

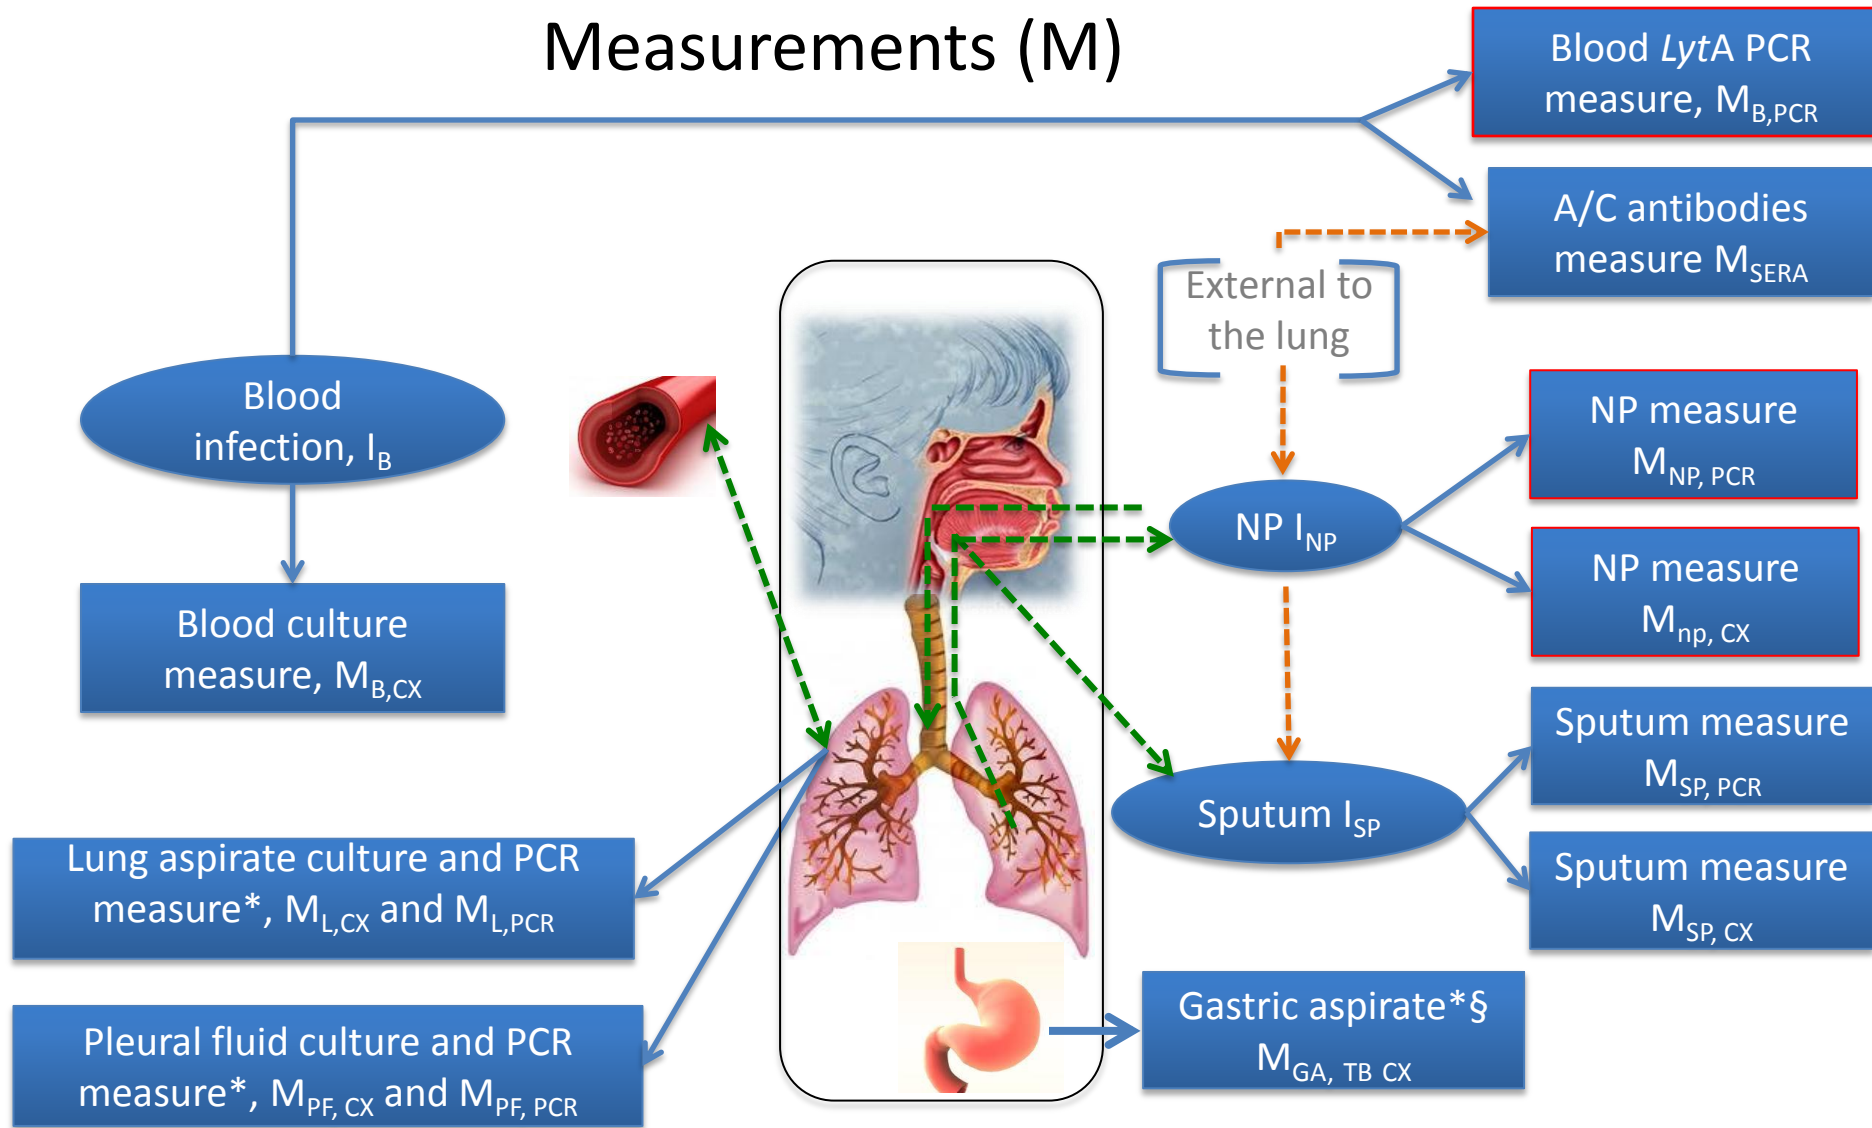

4. PERCH Quantitative

PERCH Quantitative (PQ) model (probabilistic model)

Model Framework for Infections (I) and Pathogen Measurements (M)

* collected on a subset of cases

§ TB testing only

Alternative Paradigms of Pneumonia Aetiology

- Traditional view – one pathogen per pneumonia episode

Is pneumonia a polymicrobial disease?

Polymicrobial Paradigm

- Pneumonia is (usually) a polymicrobial disease
- Pneumonia is a consequence of upper respiratory flora getting in the wrong place
- Precipitating/initiating factors may include:
 - Recent respiratory virus infection
 - Malnutrition
 - Other causes of immune suppression
- If the upper respiratory flora includes a more virulent pathogen (e.g. *S. pneumoniae*), that microbe may predominate

Implications of the Paradigm Shift

- It explains why:
 - There are big gaps in the aetiology pie chart
 - Two or more potential pneumonia pathogens are frequently detected in individual patients
 - Good quality sputum frequently contains “oropharyngeal flora” only

Implications of the Paradigm Shift

- Does not lessen the importance of key individual pathogens and prevention by vaccination
- Questions the validity of the simple bacterial versus virus concept of pneumonia aetiology
- Redirects research efforts to focus on:
 - the respiratory microbiota
 - triggers for pneumonia
 - Pathogen-pathogen interactions

Bighorn sheep pneumonia: Sorting out the cause of a polymicrobial disease

Thomas E. Besser^{a,*}, E. Frances Cassirer^b, Margaret A. Highland^{a,c}, Peregrine Wolff^d, Anne Justice-Allen^e, Kristin Mansfield^f, Margaret A. Davis^g, William Foreyt^a

Concluding Comments

- Its sometimes hard being a pneumonia researcher
- It is important to challenge dogma
- Look out for the PERCH study publications
